About forty miles west of Abilene on Interstate 20, Sweetwater ...

At present, several processes have been developed to recover material and energy from wind turbine blades, but they have not reached cost parity with landfilling.

On average, 3,000 -9,000 blades are being taken out of service per year in the United States, and that number is expected to increase to 10,000-20,000 blades per year by 2040. While ...

About forty miles west of Abilene on Interstate 20, Sweetwater has unwittingly become home to what is possibly the world's largest collection of unwanted wind turbine blades.

However, thousands of wind turbines are reaching the end of their operational lifespan and need to be either repowered to make way for updated (often larger) turbines or entirely ...

A new study led by the University of South Australia indicates tens of thousands of wind turbine blades will end up in landfill by the end of the decade unless end-of-life programs are ...

Pre-cut turbine blades are fed into a hopper on top, which pulverises them into smaller pieces. The waste is then moved up a conveyer belt built with a skid-mount design that empties the ...

Explore the hidden costs of decommissioning wind turbines in the US. Uncover the challenges and solutions. Take action now!

Wind turbine blades are made of a tough but pliable mix of resin and fiberglass--similar to what spaceship parts are made from. Decommissioned blades are difficult and expensive to transport.

Wind turbine decommissioning presents a major waste management challenge. After 20 or so years of

Destroying the wind blades of a generator costs tens of thousands

production, most turbines are decommissioned. Many metals in the electronics, ...

In densely populated Britain, discarding thousands of old turbine blades so casually in plain sight would hardly be tolerated -- the 100,000 tonnes of them each year are instead largely ...
