Can energy storage technology be used in power systems?

With the advancement of new energy storage technologies, e.g. chemical batteries and flywheels, in recent years, they have been applied in power systems and their total installed capacity is increasing very fast. The large-scale development of REG and the application of new ESSs in power system are the two backgrounds of this book.

What is pumped hydroelectric storage (PHS)?

In order to cope with the challenges brought by the large-scale REG integration to the planning and operation of power systems, the deployment of energy storage system (ESS) has become an important and even essential solution. At present, pumped hydroelectric storage (PHS) is the largest and most mature energy storage type applied in power systems.

Who should read the power system planning book?

This book can be used as a reference book for graduate students and researchers who are interested in operation and planning of power systems. It should also be useful for technicians in power network planning, power system dispatch, and energy storage investment/operation companies.

What is a battery or flywheel energy storage system?

Compared with the thermal generating units, a battery or flywheel energy storage system can respond to frequency regulation commands sent from power system control center with shorter delay and faster ramping speed.
