New York, NY, USA agl2142@columbia Abstract--Lithium-ion battery strings are important modules in battery packs. Due to cel. variation, strings may have im-balanced state of charge levels, reducing ...

For battery systems an accurate estimation of the current distribution within these parallel configurations is crucial for optimal operation and system design. The present paper provides an ...

So, when a series string of batteries is charged, this difference in resistance will cause a variance in terminal voltages on each battery. Their voltages become "unbalanced".

Compared to welding seam and cross-connector resistances, the string connector resistance dominates the current distribution. Like the behavior of a single cell, the system"s rate ...

Since lithium cells must be managed on a cell level, parallel lithium strings dramatically increase the complexity and cost of the battery management and introduce many additional points of failure and ...

Connecting multiple lithium batteries into a string of batteries allows us to build a battery bank with the potential to operate at an increased voltage, or with increased capacity and runtime, or both.

This paper addresses the parameter estimation problem for lithium-ion battery pack models comprising cells in series. This valuable information can be exploited in fault diagnostics to ...

In this paper, we use a Bayesian approach to estimate the (possibly non-Gaussian) posterior probability distribution of model parameters in a 2-cell lithium-ion battery described by equivalent-circuit models.

In series and parallel strings connected Lithium-ion (Li-ion) battery modules or packs, it is essential to equalise each Li-ion cell to enhance the power delivery performance and usable...
