Can power-to-gas convert surplus electricity into combustible gases?

Power-to-Gas (PtG), a chemical energy storage technology, can convert surplus electricity into combustible gases. Subsurface energy storage can meet the requirements of long term storage with its large capacity. This paper provides a discussion of the entire PtG energy storage technology process and the current research progress.

What is power to gas (P2G) technology?

Power to gas (P2G) is a technology that converts electricity into gases like H<sub>2</sub> and O<sub>2</sub> and is expected to meet future high-capacity energy storage needs. In this paper, we present an electric-gas system coupled with electricity and gas as well as an operational analysis to solve the energy dispatch problem in P2G technology.

Where can energy gas be stored?

The storage of energy gas is an indispensable part of the system generated by electrolysis can be stored in gas storage tanks, salt caverns underground, or injected into natural gas pipelines at a certain concentration for further use.

What is the key to energy storage?

The key to this technique, however, is the availability of suitable geological reservoirs. Depleted oil or gas reservoirs, salt formations and saline aquifers have been widely recognized as energy storage formation (as shown in ).

In the transition to decarbonized energy systems, Power-to-Gas (PtG) processes have the potential to connect the existing markets for electricity and hydrogen. Specifically, reversible PtG ...
