Pumped Thermal Electricity Storage (PTES) is an energy storage device that uses grid electricity to drive a heat pump that generates hot and cold storage reservoirs.

Aiming at problems such as the low efficiency of renewable energy conversion and the single energy flow mode, this paper proposes a heat pump energy storage system combining cold, ...

We investigate the impacts of a planned 1000 MW PS scheme connecting Lago Bianco with Lago di Poschiavo (Switzerland) on temperature and particle mass concentration in both basins.

There have been a number of PTES systems proposed using different thermodynamic cycles, including the Brayton cycle, the Rankine cycle, and the transcritical Rankine cycle.

In this review we study a storage option that has garnered extensive interest in the recent years: pumped thermal energy storage or PTES. It is a highly versatile storage option which is not ...

This work was authored in part by the National Renewable Energy Laboratory, operated by Alliance for Sustainable Energy, LLC, for the U.S. Department of Energy (DOE) under Contract No. DE-AC36 ...

If we allow the mass to fall back to its original height, we can capture the stored potential energy Potential energy converted to kinetic energy as the mass falls

Given the limitations of traditional pumped storage power station technical water supply systems, particularly their low level of intelligence and the challenge

We investigate the impacts of a planned 1000 MW PS scheme ...

The main focus of this paper is low temperature reservoir (LTR), one of the critical component in PTES

systems, as its performance effects the low pressure of the system there-by pressure ratio across ...

Pumped thermal energy storage (PTES) is a grid-scale energy management technology that enjoys geographical in-dependence together with a predicted low cost of energy capacity.
