---

This article explores the journey of 2D black phosphorus from its preparation to its groundbreaking applications in powering our technological future.

Black Phosphorus has been explored for energy conversion applications, including solar cells and fuel cells. BP's tunable bandgap and high carrier mobility make it suitable for photovoltaic ...

This article explores the current state of synthesis of few layer black phosphorus derivatives and their successful application in various emerging solar cells.

Controlled functionalization of 2D black phosphorus (BP) nanosheets provides unique opportunities to tune their chemical, physical, and electronic properties. Herein, the preparation of single-atom nickel ...

Black phosphorus, a new type of semiconductor material, has garnered significant attention due to its distinctive properties, particularly its direct band gap with tunable layers and high ...

In this thesis, a photocatalytic system for the generation of syngas under simulated solar irradiance is described that satisfies these challenges using black phosphorus (BP) and carbon nitride loaded with ...

Overall, this review synthesizes recent progress in the development of black phosphorus for energy storage applications, offering insights into both its current capabilities and its potential for ...

BP was revealed to be an ambipolar semiconductor with a tunable direct bandgap. 2D structure make BP an ideal candidate for application in many fields. To date, BP has been. highlighting the ...

Herein, by embedding carbon nanoparticles into the interlayer of BP microplates, the designed BP/carbon nanoframe (BP/C NF) forms a certain nano-gap on the substrate for promoting ...

This review briefly summarizes the latest research progress of black phosphorus and its composites in energy preparation and storage, as well as ammonia nitrogen fixation, and also looks ...
