Blade failure is widely recognized as the most frequent and costly type of wind turbine failure. Despite their aerodynamic design and robust materials, turbine blades endure extreme ...

Should wind turbine blades be flat, bent or curved. The wind is a free energy resource, until governments put a tax on it, but the wind is also a very unpredeic

Understanding common failure causes in wind turbines is essential for optimising performance and reducing maintenance costs. This article explores seven key failure types, providing insights into their ...

It is not uncommon for wind turbine blades to be struck by lightning, particularly in storm-prone regions. Lightning strikes can cause issues such as delamination, or internal damage if systems are ...

A review of the root causes and mechanisms of damage and failure to wind turbine blades is presented in this paper. In particular, the mechanisms of leading edge erosion, adhesive joint degradation, ...

Critical blade defects leading to failure of blades can be caused by excessive force or fatigue damage. This poses a significant risk and creates extreme economic impact for a wind ...

This blog article describes 11 risks that can lead to blade failures in wind turbines and how continuous condition monitoring can help prevent these.

One of the most frequent failure types, wind turbine blade damage can result from extreme weather (hail, lightning, high winds), debris impact, or material fatigue over time.

Wind turbine blades are critical components that convert wind energy into electricity. These massive structures are subjected to harsh environmental conditions, including wind, rain, ice, and extreme ...
