What are the utilization hours of China's Wind power generation equipment?

Utilization hours refer to the annual power produced, divided by rated power. As can be seen from Figure 4, the utilization hours of China's wind power generation equipment fluctuated to a certain extent, with the lowest point of 1724 h in 2015 and the highest value of 2103 h in 2018.

Is the value of wind power utilization efficiency still good?

The forecasted value of wind power utilization efficiency in South China and Central China has declined compared with 2019, but the development trend is still good. The 8-year average of 2013-2020 has also increased compared with the 7-year average of 2013-2019.

How should wind power development be managed?

Therefore, when considering wind power development, the management of wind power development should be strengthened, in order to realize the optimal allocation of resources. In terms of wind power utilization, the output scale of wind power utilization should be expanded to increase the contribution of wind power products to the national economy.

What is the average wind power utilization efficiency in China?

The average wind power utilization efficiency of Henan, Tianjin, and Hainan is between 0.3 and 0.4, and the average wind power utilization efficiency of Beijing, Qinghai, and Chongqing is the lowest, at less than 0.3.

CN: Power Generating Equipment Utilization: Wind Power: Anhui data was reported at 2,139.000 Hour in 2023. This records a decrease from the previous number of 2,142.000 Hour for 2022. CN: Power Generating ...

Utilization hours refer to the annual power produced, divided by rated power. As can be seen from Figure 4, the utilization hours of China's wind power generation equipment fluctuated to a certain extent, with the lowest ...

The input indicators include wind power installed capacity and wind power utilization hours, the desired output indicator is wind power generation, and the undesired output indicators are curtailed wind ...

As can be seen from Figure 4, the utilization hours of China's wind power generation equipment fluctuated to a certain extent, with the lowest point of 1724 h in 2015 and the highest value of 2103 ...

# Wind power generation utilization hours

China's renewable electricity generation capacity is expected to continue growing in 2026, driven by strong solar power expansion, despite a slight decline in average wind power utilization hours ...

As a kind of green and pollution-free renewable energy, wind energy has great development prospects. How to promote the development of the wind power industry and improve the efficiency of wind ...

The Global Renewable Energy Generation Outlook 2026 projects that average wind power generation hours in China will reach about 2,100 hours in 2026, a slight decrease from 2025. This metric ...

Wind power generation, 2025 Annual electricity generation from wind is measured in terawatt-hours (TWh) per year. This includes both onshore and offshore wind sources.

The continuous elevation of wind power consumption pressure has proposed higher requirements for the technical means, which comprehensively support the wind power consumption. The power generation level of ...
